

Fit into MICROBIOLOGY TESTING WORKFLOW

High-income countries testing Workflows and AMR DetecTool

ORIOI CUXART, IESE Business School

30.11.2021

Testing Workflow

Variability → multiple valid workflows can co-exist. Different implementations of the standard (?) procedures

Labs conditioned by:

- Budget
- Prevalence
- Human resources
- Space
- Expertise
- Number of samples
- Reimbursement

Prescriber Workflow

How AMR DetecTool fits in the lab working hours/organization?

FIT IN
WORKFLOWS

Number of tests per week

Sample	ESBLs #	CARBA #	Total per week
Blood	13	10	23
Urine	12	9	21
Rectal swabs	62	52	114
Total	87	71	158

Rectal swabs bigger market, but challenging:

- Might not be in a rush (except high-risk patients screened at arrival)
- Price of chromogenic agar (5 Eur)

FIT IN

Maximum price

Gabor granger pricing study method, based on 9 participating hospitals.

Average maximum amount willing to pay for AMR DetecTool = **13,30 Eur**

Use cases

Main added value = speed + cost (specially PCR)

Fast result needed:

- Septic patients, ICU
 - Urosepsis
- High risk patients hospitalized
- Outbreak
- **Other settings? POC? DTW**
- **Economic study:** It looks like there is a high economic value, literature.
